ScorePredictionUsingRegression

March 5, 2023

1 1. Setting Up

- Introduction
- Loading Libraries
- Loading Data

2 2. Exploratory Data Analysis(EDA)

- Data Distribution(Univariate Analysis)
- Visualization

3 3. Prediction and Submission

- Train-Test Split
- Simple Logistic Split
- Prediction and Submission
- Visulaize and submit the

4 Setting Up

4.1 1.1 Introduction

- We need to predict the score of student based on the time duration(in hours) they study
- We are using Linear Regression Algorithm for prediction
- For evaluation we calculating these three value Mean Absolute Error,Coefficent of determination and Root Mean Square.

4.2 1.2 Loading Libraries

[ ]:
```
# Data Analysis
import pandas as pd

# Visualization
import seaborn as sns
import matplotlib.pyplot as plt
import plotly.express as px
```

```
%matplotlib inline

# Machine Learning
from sklearn.linear_model import LinearRegression
from sklearn.model_selection import train_test_split
from sklearn.metrics import r2_score
from sklearn.metrics import mean_absolute_error
from sklearn.metrics import mean_squared_error
```

4.3 1.3 Loading Data

[ ]:
```
raw_url = "https://raw.githubusercontent.com/AdiPersonalWorks/Random/master/
  ↪student_scores%20-%20student_scores.csv"
df = pd.read_csv(raw_url)
df
```

[ ]:

	Hours	Scores
0	2.5	21
1	5.1	47
2	3.2	27
3	8.5	75
4	3.5	30
5	1.5	20
6	9.2	88
7	5.5	60
8	8.3	81
9	2.7	25
10	7.7	85
11	5.9	62
12	4.5	41
13	3.3	42
14	1.1	17
15	8.9	95
16	2.5	30
17	1.9	24
18	6.1	67
19	7.4	69
20	2.7	30
21	4.8	54
22	3.8	35
23	6.9	76
24	7.8	86

5 2. Exploratory Data Analysis(EDA)

5.1 2.1 Univariate Analysis

As we only have Continous varibles in our Data.

In Univariate Analysis we need to understand **Central Tendency** and **Spread of Data/Measure of Dispersion**, for visualization we can use **Histogram Plot** and **Box Plot**.

To measure Central Tendency and Dispersion we have serval method some are Mean, Median, Mode and Range, IQR(Inter Quartile Range), Standard Deviation, Varience etc.

[ ]:
```
print(f'Size of the data is: {df.shape}')
```

```
Size of the data is: (25, 2)
```

[ ]:
```
print(f'Type and distribution of Data is: ')
df.info()
```

```
Type and distribution of Data is:
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 25 entries, 0 to 24
Data columns (total 2 columns):
 #   Column  Non-Null Count  Dtype
---  ------  --------------  -----
 0   Hours   25 non-null     float64
 1   Scores  25 non-null     int64
dtypes: float64(1), int64(1)
memory usage: 528.0 bytes
```

[ ]:
```
# Null values
print(f' Sum of Null values in Data:')
df.isnull().sum()
```

```
 Sum of Null values in Data:
```

[ ]:
```
Hours     0
Scores    0
dtype: int64
```

[ ]:
```
# mean, median and mode of Scores
print('Mean',' '*5,df['Scores'].mean())
print('Meidan',' '*5,df['Scores'].median())
print('Mode',' '*5,df['Scores'].mode())
```

```
Mean       51.48
Meidan       47.0
Mode       0    30
dtype: int64
```

[ ]:
```
# Standard deviation of marks
print('Standard deviation ',df['Scores'].std())
```

```
Standard deviation  25.28688724747802
```

[ ]:
```
print(f'Descriptive analysis for measuring Central Tendency data is: ')
df.describe()
```

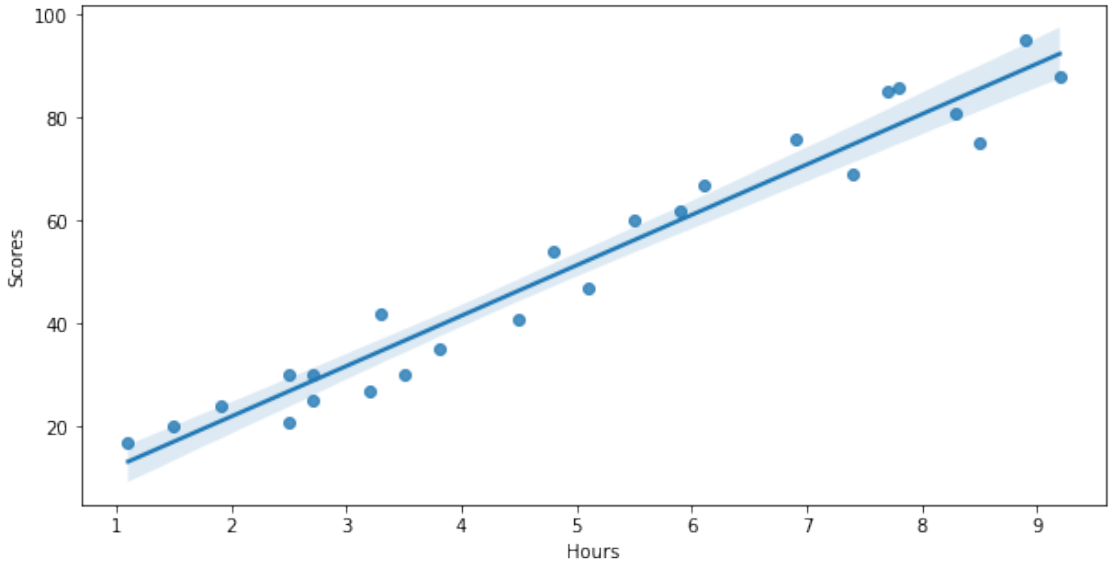
```
Descriptive analysis for measuring Central Tendency data is:
```

[ ]:

	Hours	Scores
count	25.000000	25.000000
mean	5.012000	51.480000
std	2.525094	25.286887
min	1.100000	17.000000
25%	2.700000	30.000000
50%	4.800000	47.000000
75%	7.400000	75.000000
max	9.200000	95.000000

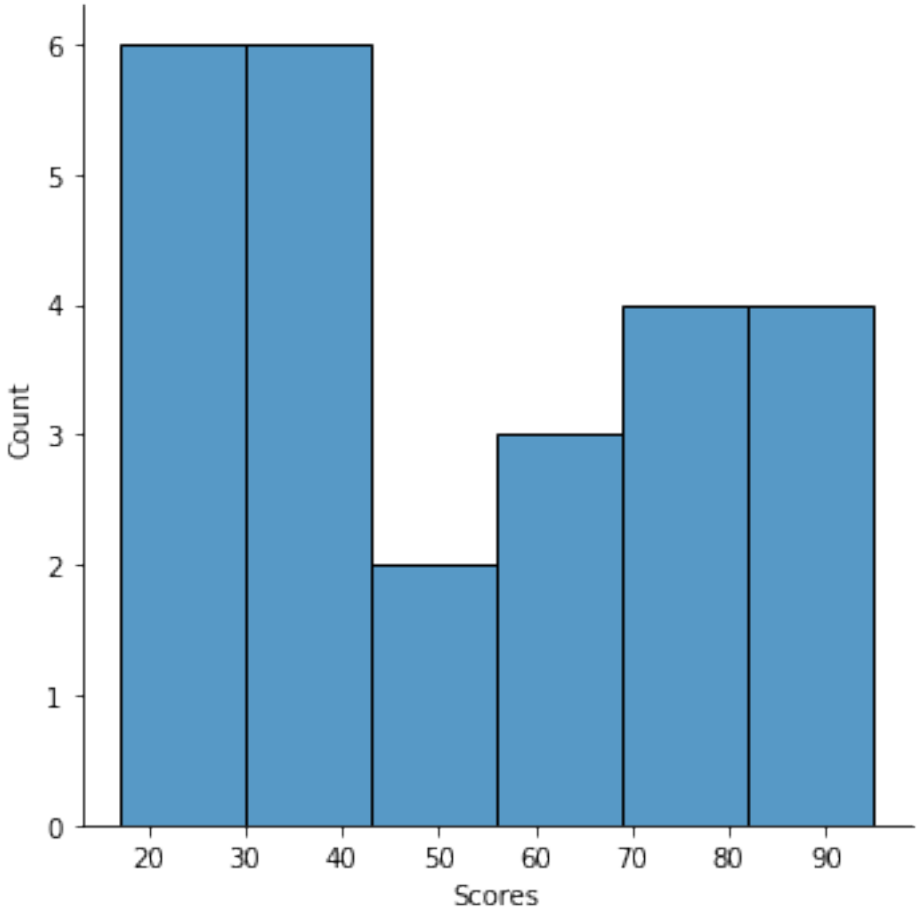
5.2 2.2 Visualizing the Data

[ ]:
```
# Relationship between scores and time for outliers
plt.figure(figsize=[10,5])
sns.regplot(x=df['Hours'],y=df['Scores'])
plt.show()
```



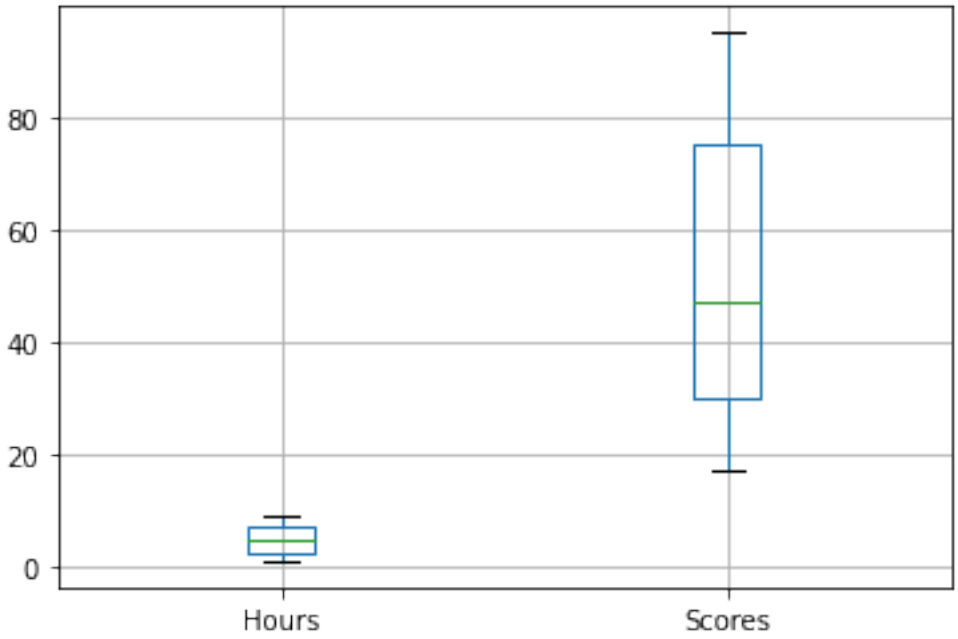
[ ]:
```
# Distribution of Scores
sns.displot(df['Scores'])
```

[ ]: <seaborn.axisgrid.FacetGrid at 0x7f4410e10df0>



[ ]:
```
# boxplot fo routliers
df.boxplot()
```

[ ]: <AxesSubplot:>



6 Model development and Evaluation

6.1 3.1 Train-Test Split

[ ]:
```
X = df.iloc[:,:-1]
y = df.iloc[:,-1]
```

[ ]:
```
# Spliting the data for training and testing
X_train,X_test,y_train,y_test = train_test_split(X,y,test_size=0.
↪25,random_state=0)
```

6.2 3.2 Linear Regression

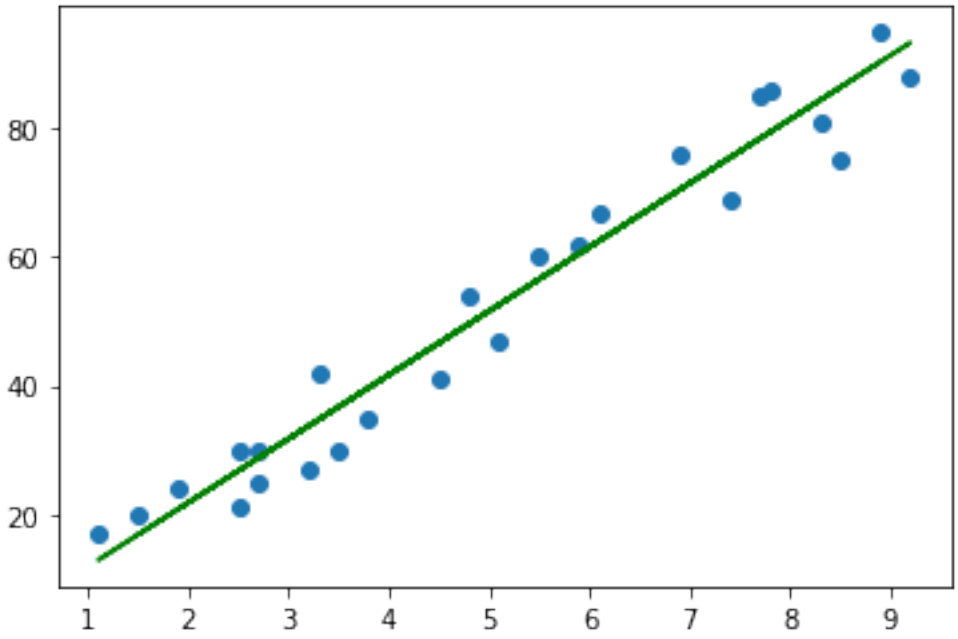
[ ]:
```
# Training the model
reg = LinearRegression()
model = reg.fit(X_train,y_train)
```

[ ]:
```
# plot of Training
intercept = model.intercept_
coef = model.coef_

reg_line = intercept+coef*X

plt.scatter(X,y,)
plt.plot(X,reg_line,color='g')
```

```
plt.show()
```



6.3 Prediction and Submission

[ ]:
```
# Predicting output
y_pred = model.predict(X_test)
```

6.4 Evaluating and submition

[ ]:
```
# Error in prediction
print(f'Mean Absolute Error: ',mean_absolute_error(y_test,y_pred))
print(f'r^2 Coefficent of Determination (Best 1): ',r2_score(y_test,y_pred))
print(f'Root Mean Square: ',mean_squared_error(y_test,y_pred))
```

```
Mean Absolute Error:  4.130879918502482
r^2 Coefficent of Determination (Best 1):  0.9367661043365056
Root Mean Square:  20.33292367497996
```

[ ]:
```
result_df = pd.DataFrame({'Actual':y_test,'Predicted':y_pred})
result_df
```

[ ]:

	Actual	Predicted
5	20	16.844722
2	27	33.745575
19	69	75.500624
16	30	26.786400

```
11      62  60.588106
22      35  39.710582
17      24  20.821393
```

[ ]:
```
plt.figure(figsize=(10,5))
plt.scatter(X,y,label='Actual data')
plt.scatter(X_test,y_test,label='Test data',marker='+')
plt.xlabel("Hours")
plt.ylabel("Scores")
plt.title("Actual Data and Test Data")
plt.legend()
plt.show()
```
